Received on September 9, 1965

ABSTRACT

Using the reduced temperature-entropy and reduced temperature-enthalpy data of argon as a function of pressure and the principle of corresponding states, a temperature-entropy-enthalpy diagram for chlorine up to a pressure of 2200 atmospheres and a temperature up to 1500°K is presented. The evaluated values agree within 1 per cent with the available literature data. The data on enthalpy, entropy and volume is presented in tabular form.

INTRODUCTION

An extensive literature survey revealed that the thermodynamic properties of chlorine are available only in a limited range of temperature and pressure. The previous investigations (summarized well by Kapoor and Martin⁷) include those of Hulme⁴, Hulme-Tillman⁵, Kapoor and Martin⁷, Pellaton⁹ and Ziegler¹². These authors have contributed either to experimental study or calculation of the thermodynamic properties of chlorine. Kapoor and Martin have utilized the Martin-Hou⁸ equation of state and have calculated the thermodynamic properties up to a pressure of 95 atmospheres and a temperature of 550 °K. This is the maximum temperature and pressure range investigated so far. The present work was undertaken with the following objectives in view.

- (i) to cover a wider range of temperature and pressure so as to cover the area of interest both in research and industrial application,
- (ii) to test the validity of the proposed law of corresponding states¹, and
- (iii) to present data for the starting material in the chlorinated organic compounds series, the evaluation of the thermodynamic properties of which this laboratory has undertaken.

PRESENT WORK

The present investigation has utilized the data on isothermal changes of enthalpy and entropy with pressure of argon and the principle of the law of corresponding states. This principle states that the departure of any property from that of the reference substance at the same reduced properties is the same. The reference substance chosen for various reasons¹, is argon. The

properties of argon have been evaluated² for pressures up to 5000 atmospheres and for temperatures up to 600 °K. The investigation of Achuta Ramayya and Kuloor¹ has revealed that the percentage deviation of

$$(\Delta S)_{T_r} \Big|_{P_r=0.05}^{P_r}$$

from argon values for various substances conforms (especially above $T_r = 1.2$) well with the above stated principle of corresponding states. In the present work, the values of enthalpy and entropy were calculated using the relations,

$$(\Delta S)_{T_r} = (\Delta S)_{T_r} \Big|_{P_r=0.05}^{P_r} + (\Delta S)_{T_r} \Big|_{P_r=0}^{P_r=0.05} \quad [1]$$

$$(\Delta H)_{T_r} = (\Delta H)_{T_r} \Big|_{P_r=0.05}^{P_r} + (\Delta H)_{T_r} \Big|_{P_r=0}^{P_r=0.05} \quad [2]$$

So the procedure is

(i) evaluate the property at T and $P = 0.05 P_c$ for the substance (chlorine) in question.

(ii) add the value of that property from $P = 0.05 P_c$ and the desired pressure P evaluated at T using the argon diagram or data.

The 0.05 P_c datum line for chlorine was evaluated in the following way. The ideal gas constant pressure heat capacity data of Potter¹⁰ obtained from spectroscopic data in the temperature range of 300-1500 °K was fitted to the equation,

$$C_p^o = a + bT + cT^2 + dT^3 + eT^4 \quad [3]$$

where $a = 5.924545453$

$$b = 1.16402316 \times 10^{-2}$$

$$c = -1.785920995 \times 10^{-5}$$

$$d = 1.242251082 \times 10^{-8}$$

$$e = -3.172077922 \times 10^{-19}$$

The maximum error of the calculated values using Equation [3] was 0.75 per cent. The basic reference point was taken as $S = 0, H = 0$ for crystal at absolute zero of temperature. At lower temperatures over the range of 200-553 °K, the specific heat data C_v^o of ideal gas is fitted by Kapoor and Martin⁷ to the quadratic relation

$$C_v^o = \alpha + \beta T + \gamma T^2 \quad [4]$$

where $\alpha = 5.701272 \times 10^{-2}$

$$\beta = 7.294438 \times 10^{-4}$$

$$\gamma = -3.675117 \times 10^{-8}$$

Next Equation [4] and Giauque-Powell³ data on entropy of chlorine at the normal boiling point together with Berthelot's correction for pressure were utilised to evaluate the entropy value at $T_r = 0.8$ and $P_r = 0.05$. Using this entropy value and Equation [3] (as it covers a range of temperature of 300-1500 °K), the entropy equation at $P_r = 0.05$ was obtained,

$$\int ds = S_{T, 0.05} \\ = a \ln T + bT + cT^2/2 + dT^3/3 + eT^5/5 \\ + \left([\text{Berthelot's correction}] \right)_{P_r=0}^{P_r=0.05} + C \quad [5]$$

where C is the constant of integration.

The constant of integration was evaluated using the entropy value at $T_r = 0.8$ and $P_r = 0.05$. Thus the entropy equation at $P_r = 0.05$ P_c was obtained. The values got from Equation [5] at $P_r = 0.05$ and various T_r values are compared with those of Kapoor and Martin. The maximum deviation was about 0.3 per cent. Table I also shows values evaluated at different P_r values using Equation [1] and argon values. A comparison with the values of Kapoor and Martin was made and the deviations are shown in Table I. The maximum and average deviations are around 0.5 and 0.3 per cent respectively.

TABLE I
Comparison of calculated entropy(S) and enthalpy(H) values with literature values¹

T_r	P_r range	No. of points	Per cent average deviation		Per cent maximum deviation	
			S	H	S	H
0.8	0.05 - 0.2	3	0.23	0.12	0.43	0.13
0.9	0.05 - 0.3	4	0.10	0.11	0.13	0.20
1.0	0.05 - 0.8	7	0.10	0.12	0.28	0.23
1.1	0.05 - 1.2	9	0.10	0.20	0.26	0.67
1.2	0.05 - 1.2	9	0.24	0.27	0.49	0.50
1.3	0.05 - 1.2	9	0.30	0.40	0.44	0.70

The values of entropy were then evaluated in the region of $T_r = 0.8$ to 3.4 and $P_r = 0.05$ to 30. using Equation [1] and argon values. The values are presented both in graphical, as Figure I* and tabular form, as Table III.

* 80 cm × 100 cm diagram can be obtained from the authors

TABLE V
Comparison of the calculated values of volume of chlorine with literature⁷ values

Pressure atmospheres	Temperature °K	No. of points	Average per cent deviation	Maximum per cent deviation
5	340 – 540	11	0.076	0.271
10	380 – 540	9	0.233	0.344
20	380 – 540	9	0.313	0.742
40	420 – 540	7	0.874	2.178
60	420 – 540	7	0.791	1.939
75	420 – 540	7	1.269	3.782
90	420 – 540	5	0.731	1.157
Overall maximum % Deviation				— 3.78
Overall average % Deviation				— 0.54

The enthalpy values were also evaluated similar to the entropy values. The constant of integration was evaluated similarly using the experimental value of Graque and Powell³ at the normal boiling point. Table I shows the deviation from the values of Kapoor and Martin. The average and maximum deviations are 0.4% and 0.7% respectively. Table II shows the values of enthalpy in the region of $T_r = 0.8$ to 3.4 and $P_r = 0.05$ to 30. Table IV shows a comparison of the enthalpy departure from ideal gas of the present work with those of Kapoor and Martin and of Lydersen, Greenkorn and Hougen (values corresponding to $Z_c = 0.27$). It can be seen from Table IV that the proposed law of corresponding states is better than the three parameter law used by Lydersen *et al.* The deviations decrease above $T_r = 1.2$, possibly because the effect of Z_c above such temperatures is negligible. This also shows that Z_c may not be the ideal parameter to characterize inter-molecular effects.

MOLAL SPECIFIC VOLUME

In the region of available data in the literature, the compressibilities of chlorine calculated using the compressibilities of argon and the law of corresponding states in the form $Z = f(P_r, T_r)$ showed good agreement with the literature values. Table V shows such a comparison with the values tabulated by Kapoor and Martin⁷. The values of volume of chlorine therefore, were calculated using argon compressibility values and tabulated in Table III.

NOMENCLATURE

$a, b, c, d, e,$	- constants in Equation [3]
C_p^o	- ideal gas specific heat at constant pressure, cal./gram mole °K
C_v^o	- ideal gas specific heat at constant volume, cal./gram mole °K
H	- enthalpy, cal./gram mole
S	- entropy, cal./gram mole °K
P	- pressure, atm.,
T	- temperature, °K
V	- volume, cc./gram mole
α, β, γ	- constants in Equation [4]
ΔH_v	- enthalpy of vaporisation, cal./gram mole
ΔS_v	- entropy of vaporisation, cal./gram mole °K
<i>l</i>	refers to liquid
<i>g</i>	refers to gas or vapour
